

Nimbus API Reference (excerpt)

The Nimbus REST API is available at `https://api.nimbus.example.com/v1``.

All requests require an `Authorization: Bearer `` header. Tokens are issued from the Workspace's Developer Settings page and can be scoped to read-only or read-write access.

Upload a file

`POST /v1/files/upload``

Accepts a multipart/form-data body with a `file`` field and an optional `folder_id`` field. Maximum upload size via this endpoint is 5 GB; larger files must use the chunked upload endpoint at `/v1/files/upload/chunked``.

List files

`GET /v1/files?folder_id={id}&page;={n}``

Returns up to 100 files per page. The response includes a `next_page`` cursor when more results are available.

Rate limits

The API enforces a rate limit of 600 requests per minute per token on Team and Business plans, and 2000 requests per minute on Enterprise. Exceeding the limit returns HTTP 429 with error code `ERR_429_RATE_LIMIT`` and a `Retry-After`` header in seconds.

Errors

Authentication failures return HTTP 401 with error code `ERR_401_INVALID_TOKEN``. Requests to a folder the token cannot access return HTTP 403 with error code `ERR_403_FORBIDDEN``. Malformed request bodies return HTTP 400 with error code `ERR_400_BAD_REQUEST``.

Webhooks can be registered at `/v1/webhooks`` and will POST a JSON payload

to the configured URL on file create, update, and delete events.
