

Nimbus Overview

Nimbus is a cloud file storage and collaboration platform for teams. It lets users upload, organize, and co-edit documents, spreadsheets, and design files from a browser or the desktop sync client.

Every file uploaded to Nimbus is automatically versioned. Nimbus keeps the last 100 versions of a file, or 30 days of history, whichever is greater.

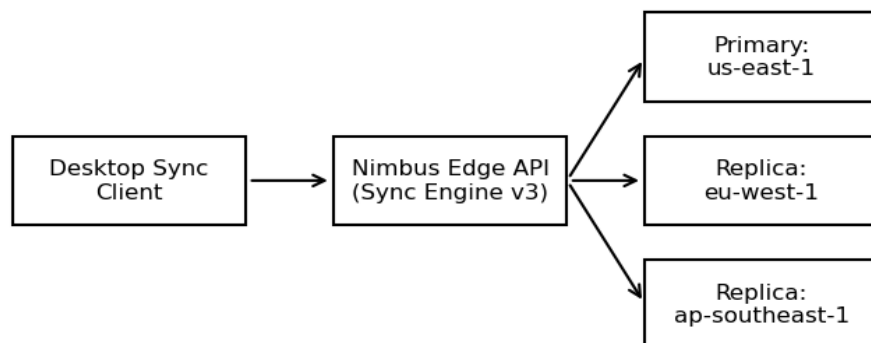

Older versions are pruned by a nightly cleanup job.

Nimbus organizes content into Workspaces. A Workspace is the top-level container for a team's files, members, and shared links. Each account on the Free plan may create at most 1 Workspace; paid plans allow unlimited Workspaces.

Real-time co-editing is available for Nimbus Docs and Nimbus Sheets. Up to 50 users can edit the same document simultaneously before Nimbus switches the document to read-only mode for additional viewers.

The desktop sync client is available for macOS, Windows, and Linux. It watches a local folder and mirrors changes to the cloud within roughly 5 seconds under normal network conditions.
