

Troubleshooting

****Sync client stuck on "Syncing..."**** — This is usually caused by a file with an unsupported character in its name (Nimbus disallows ` \ / : \* ? " < > | `). Check the sync log at `~/nimbus/sync.log` (macOS/Linux) or `%APPDATA%\Nimbus\sync.log` (Windows) for a line containing `SKIPPED\_INVALID\_NAME`.

****Uploads failing with ERR_413_TOO_LARGE**** — The standard upload endpoint rejects files over 5 GB. Files larger than 5 GB must be uploaded through the desktop client or the chunked upload API, both of which split the file automatically.

****Co-editing shows "switched to read-only"**** — This happens when a document exceeds the 50 simultaneous editor limit. Additional users are downgraded to viewers until an active editor's session ends.

****SSO login loop on Business/Enterprise**** — Usually caused by a clock skew greater than 5 minutes between the identity provider and Nimbus's SAML validation service, which rejects assertions outside that window. Syncing the IdP server clock via NTP resolves most cases.

****Missing files after a region migration**** — As noted in the security documentation, Nimbus does not migrate primary data across regions automatically; files must be manually copied into a new Workspace created in the target region.

For issues not covered here, contact support through the in-app chat widget; Team plan and above receive a response within 24 hours per the plan's SLA.
